

LIMESTONE BLENDED CEMENTS

Project Title : Assessment of High Early Strength Limestone Blended Cement for Next Generation Transportation Structures

Objective: To evaluate the effects higher fineness limestone blended cements developed for high early strength in precast prestressed concrete construction, considering both material properties and structural performance, including:

- Assessment of key early age behaviors (e.g., setting time, workability, strength development, shrinkage)
- Assessment of long-term performance criteria (e.g., creep, permeability) relevant to construction
